The glue proteins secreted by marine mussels bind strongly to virtually all inorganic and organic surfaces in aqueous environments in which most adhesives function poorly. Studies of these functionally unique proteins have revealed the presence of the unusual amino acid 3,4-dihydroxy-L-phenylalanine (dopa), which is formed by posttranslational modification of tyrosine.

J.L. MASSINGILL JR., R.S. BAUER, in Applied Polymer Science: 21st Century, 2000. Reactions of Epoxides and Curing Mechanisms. Epoxy resins are reactive intermediates that, before they can be useful products, must be "cured" or cross-linked by polymerization into a three-dimensional infusible network with co-reactants (curing agents). Cross-linking of the resin can occur through the epoxide ...

"Adhesive Bonding" by L.H. Lee from Abe Books or. 1999. It sound like we're all saying, "if it works, don't try to fix it." We recently had a "think outside the box" training program in our R & D Dept., where we essentially learned not to assume that many of those "cast in stone" rules can't be broken. One thing I like about this business is ...

Adhesive Use on Conversion Coated Aluminum Surfaces

Underwater bonding was examined as a function of parameters including polymer molecular weight and composition. In doing so, several surprising results emerged. Poly(catechol-styrene) may be the strongest underwater adhesive found to date. Bonding even exceeded that of the reference

biological system, live mussels.

High Strength Underwater Bonding with Polymer Mimics of ...

Adhesive Bonding is the process of joining two surfaces together, usually with the creation of a smooth bond. This may involve the use of glue, epoxy, or one of a wide range of plastic agents which bond either through the evaporation of a solvent or through curing via heat, time, or pressure. Glues have tended to create relatively weak joins but with the use of new self-curing adhesives these bonds are now close to the strength of the materials themselves.
