Another strategy to increase frequency coverage without degrading VCO phase noise is to use a multiband VCO, in which overlapping frequency ranges are used to cover an octave of frequency range, and lower frequencies can be generated by using frequency dividers at the output of the VCO.

The implications of this analysis for the design of low-timing-jitter and low-phase-noise buffers, VCOs and PLLs using inverter delay cells are described. The analysis shows that timing jitter is inversely proportional to the square root
