Label Switching (MPLS)? MPLS is a packet-forwarding technology which uses labels in order to make data forwarding decisions. With MPLS, the Layer 3 header analysis is done just once (when the packet enters the MPLS domain). Label inspection drives subsequent packet forwarding. MPLS provides these beneficial applications:

MPLS FAQ For Beginners - Cisco

MPLS is best summarized as a “Layer 2.5 networking protocol”. In the traditional OSI model: Layer 2 covers protocols like Ethernet and SONET, which can carry IP packets, but only over simple LANs or point-to-point WANs. Layer 3 covers Internet-wide addressing and routing using IP

MPLS-enabled routers called Label Switch Routers (LSR).

Generally, the network consists of a core LSR with an edge LSR that applies labels to packets. This is the setup mechanism of an MPLS network: Routing tables of the different LSRs are computed with an Interior Gateway Protocol (IGP).
