### Perl Guide

Perl is a loosely typed language and there is no need to specify a type for your data while using in your program. The Perl interpreter will choose the type based on the context of the data itself. Perl has three basic data types: scalars, arrays of scalars, and hashes of scalars, also known as associative arrays.

Any Perl/Tk application starts by creating the Tk MainWindow. You then create items inside the MainWindow, and/or create new windows called Toplevel s that also contain child items, before starting the MainLoop, which is the last logical statment in your program. You can also create more items and windows while you're running, using callbacks.
